Complete the following problems

References, a video, a PowerPoint and some notes are available at my website https://www.aholdengouveia.name/LinuxAdmin/installs.html

Go through both servers and complete the following problems. Make sure your deliverables include documents for BOTH servers clearly labeled with what the document is and which server it's for

1. Check your repositories that are included by default on both servers, find out how you'd go about adding a repository, (both official and PPA) and make sure you can install programs.

2. Install Tmux, emacs, and Fail2Ban. Make sure you look through the Fail2Ban settings as you do the install.

3. Just for fun, install cowsay and lolcat. (Yes I know these are silly, the point is that i know they aren't there already.)

4. Update VI to vim, update your servers if it's needed.

5. Documentation should include locations of any files you've created or need to reference. You should include any programs you've installed or updated as well, with dates of when you've done those things.

Deliverables

Target Market is someone trying to do the installs on their servers as well, assume technical knowledge but not expertise. Screenshots are helpful to go with your descriptions.

- A document showing how you installed everything on both servers.

- A short document showing where your repos live on both servers as well as how to add/modify a repo or PPA.

- A short document outlining what you've installed on your servers, including the programs listed here.

- A short document including any updates and dependencies that needed to be done or changed and the dates that you did this. Anything you've turned on/off should be included as well, don't forget the dates that you did this

- For Fail2ban make sure you note what you've changed (if anything) and why you made that change.
